The All-around Renewable
Resource for Oil, Soil, and the
Seas

About Capilli

Capilli Trading Inc. is a Northern Mindanao-based social enterprise that involves collecting, processing, and trading human waste hair. Capilli strives to create social, economic and environmental value out of human waste hair by establishing systems that utilizes the waste product as a resource that can be traded and transformed into a sustainable by-product for different industries.

HAIR AS A POTENTIAL

We envision to be the leading research, trading and by-product manufacturing company for waste human hair in the Philippines

WHOLISTIC GROWTH

Grounded on the principles of Sustainability and creating positive socio-economic impacts to our partner communities.

About San Roque MPC

All of our products are produced with the help of our partner community, San Roque MPC. The organization is operating in the municipality of Villanueva, Misamis Oriental. The group is composed of 32 families supported by STEAG State Power Inc, the government of Villanueva and Phividec Industrial Authority.

More than a livelihood project, the San Roque community has produced women who have become competitive artists and entrepreneurs, whose craftsmanship and dedication to quality run a promising micro-enterprise. This venture has empowered women to be active contributors in their families and their community.

Hair is an abundant resource that is renewable and has promising uses due to its chemical composition and physical qualities. Human hair is a material considered useless in most societies and therefore is found in the waste streams.

Capilli and Matter of Trust PH, in partnership with the hair care industry in Northern Mindanao and San Roque Handmade Paper Products, are harnessing the potential of waste human hair through the production of —

hairmats

The All-around Renewable Resource for Oil,
Soil, and the Seas

Crafted from meticulously gathered human waste hair sourced from local salons, the Hair Mats undergo a comprehensive process of felting and disinfection to ensure their purity. This careful treatment eliminates impurities, rendering the hair mats not only an innovative solution but also a sustainable one. By repurposing discarded hair that would otherwise be discarded as waste, these mats embody a circular approach, transforming what might have been considered refuse into a valuable resource.

OIL AND CHEMICAL SPILLAGE

Small

30 x 30 x 2 cm

Weight: Approx 400 g

Large

60 x 60 x 2 cm

Weight: Approx 900 g

Adsorption Capacity

Three to nine times their weight in oil

Scope of Use

Hydrocarbons derived from petroleum, oily fatty compound substances of mineral, vegetable or liquid animal origin, hydro phenols, and other chemicals

Human hair has emerged as a remarkable tool for addressing oil spills and chemical spillage due to its inherent ability to adsorb and contain hydrophobic substances. When placed on the surface of water, hair acts as a natural absorbent, attracting and encapsulating oil molecules. The unique structure of hair, characterized by its fine fibers and rough texture, provides a large surface area for maximum contact with spilled substances. This allows hair to rapidly bind with oils and chemicals, effectively containing the spread of the spill. Once saturated, the hair can be collected, removed, and properly disposed of, minimizing the environmental impact of the spill.

The Hair Mats are designed to adsorb oil and spills of fatty substances of mineral, vegetable, or liquid animal origin, consisting of fatty acid esters

or hydrocarbons derived from petroleum. They adsorb and retain oil and fatty substances of mineral, vegetable, or liquid animal origin, made up of fatty acid esters or petroleum-derived hydrocarbons.

The product is recommended for cleaning oil spills in water and on surfaces. The best cleaning method is dragging the mat and applying pressure for better adsorption.

AGRICULTURAL

Small

Dimensions: 8 cm Ø

Medium

Dimensions: 15 cm Ø

Large

Dimensions: 23 cm Ø

Given its nutrient-rich composition, human hair can be repurposed for agricultural purposes to enhance soil fertility and plant health. When incorporated into the soil or used as a mulching material, human hair contributes to a balanced nutrient profile that supports robust plant growth. The gradual release of nutrients from hair decomposition not only nourishes plants over an extended period but also minimizes the risk of nutrient leaching, benefiting both crop yields and environmental sustainability. Furthermore, utilizing human hair in agriculture promotes the recycling of organic waste, offering a novel approach to sustainable farming practices while reducing the dependence on conventional chemical fertilizers.

The Hair Mat can cover the soil to generate water savings in agriculture. It is a 100% natural product, compostable at the end of its lifecycle. The mat reduces the need for irrigation water, provides nitrogen to the soil, and minimizes plant care by keeping weeds and pests away from the plants.

The product is also recommended for use in water-scarce areas, with two main options: first, enabling planting in arid areas where there is currently no agricultural development; second, introducing solutions to areas with significant water retention needs.

DIRECTION FOR USE

HAIR MAT ON TOP

Helps retain moisture content, slowly releases nutrients into the soil, and limits the growth of weeds.

HAIR MAT ON BOTTOM

An ideal medium for encouraging roots to develop to their full potential, reducing the need for fertilizers.

HAIR MAT ON BOTH

For optimum plant health.

The rectangular Hair Mats can be cut in the middle and wrapped around the stem or branch of a plant. Secure the mat with metal staples or wooden sticks.

Contact Us

In Capilli and Matter of Trust Philippines, we make it our mission to revolutionize waste management in the country by creating value from waste human hair.
